

COVID 19 NEGATIVE in few days BY PROPOLIS Laboratory TESTS CONFIRM

Release 1-Propolis-Covid 19 / August 24, 2020

Melidava Association, Romania

In the last weeks, together with one colleague medical doctor, we monitored by laboratory tests our patients positive for Covid 19, to whom we recommended a protocol with a propolis extract.

All turned to negative in few days, according to the laboratory tests.

The products used

- Propolis mielat (propolis tincture **30%** concentration in propolis, with honey 10%; extract in ethanol 65°), produced by Melidava
- or propolis tincture **30%** concentration in propolis, extract in ethanol 60-70°

The applied protocol

- **3 x 3 ml/day, in the first 3 days**
- **2 x 2 ml/day, further on up to 14 days**

- for the people **over 90 Kg weight**, we recommend to increase the dose to **3 x 4 ml/day, in the first 3 days**, respective to 2 x 3 ml/day further on

The administration

- morning + launch + evening, in the first 3 days
- morning + evening, further on

- in case of propolis tincture, mix it with honey, to increase the effect

The patients:

– 1. Four were hospitalized for Covid 19, treated with the medicines in use (Azitromicine or Kaletra) but they were still positive after 3 tests made before they were discharged from hospital. They started to take propolis product after discharging.

– 2. One patient had symptoms at home, lack of taste and smell, affected general condition. The debut was Friday, so the test was postponed on Monday, but the administration of propolis started immediately.

– 3. Two were healthy positives, isolated and naturally treated at home. They started to take the propolis product after the positive test.

Conventional medicines were taken only by the hospitalized ones, exclusively during the hospitalization.

– 4. In addition, over 200 people took as prophylaxis, from the beginning of the Covid pandemics, propolis mielat 3 ml/day, on morning. To them we recommended,

in case of contact with persons positive for Covid 19, to apply the above mentioned protocol.

Results

- 1. at the test in the fourth day after starting the intake of propolis, they turned **all negative**.
- 2. Until Monday, the symptoms disappeared, and the test was **negative**.
- 3. They made control tests, one at 9 days, the other at 14 days after the positive test. Both turned to **negative**.

- 4. **None** of those who took preventively, **didn't communicated to be positive**, even if some knew they were in contact with positive persons.

Again the Omniscient Nature offers a simple and fast solution in a severe situation.

We still have under observation positive persons who take propolis and will be tested.

We will continue communicating the clinical and laboratory results.

We may help more the people and would be grateful, if you will send us the information you have about other fellows who benefited from propolis versus Covid 19.

ATTENTION !

The **above doses** are available for the extract of **30% propolis concentration**.

A product labelled as propolis tincture, if having a pale colour and/or ethanol dominant smell, it is a weak extract, with low efficiency !

The propolis tincture, when well prepared by usual European or North American raw propolis, has dark brown colour. The smell of alcohol disappears, replaced by the aromatic specifically smell of the bioactive compounds of the propolis.

COVID 19 NEGATIVE in few days BY PROPOLIS Laboratory TESTS CONFIRM

*Release 2-Propolis-Covid 19 / September 30, 2020
Melidava Association, Romania*

After the Release 1, we continued to gather information about propolis related to Covid positive people.

A. Clinically cases - examples. Information provided by correspondence with the relatives of the patients:

1. Woman, 80 years old
 - Covid positive (August 2020)
 - hospitalized in intensive therapy, with oxygen saturation of the blood under 90%
 - Propolis mielat administered 3 x 3 ml/day
 - after three days, the oxygen saturation of the blood increased to 97%the test made later one week - negative

2. Woman, 61 years old
 - Covid positive (September 2020)
 - hospitalized in intensive therapy with a poor clinical condition, needing oxygen-therapy
 - Propolis mielat administered 3 x 3 ml/day
 - after three days, she didn't need anymore oxygen, she got up from the bed, started to eat and the test was negative

B. Among those **over 200 who took preventively the propolis**, there were 3 who became positive.

- important: they were having emotional disturbances - chronic sadness or frustration, which depresses the immune system
- symptoms: one has smell and taste decreased; one had fever, cough, asthenia; the third added pains in the skin and muscles, throat dryness and lack of appetite
- they didn't need hospitalization, they didn't take conventional drugs
- after following the protocol we mentioned in the Release 1 with Propolis mielat, they turned to negative.

C. **Over 300 persons requested Propolis mielat** from us after the Release 1, and non replayed that wouldn't have good results using it.

D. **Tens of direct contacts** with positive tested persons, were isolated at home 14 days, and took propolis tincture (or mielat) 2 x 2 ml/day. They didn't have a test before isolation, but the test in the 15-th day was negative for all of them.
